

NGINX configuration explanation

explain me detail process of nginx implementation like while creating config /etc/nginx/sites-available/
/etc/nginx/sites-enabled/ here what does this path mean etc / and what mean sites-available and sites- enabled

i still cannot understand sites available and sites enabled process?

can you explain me working of nginx how it cause i am enable to understand how nginx work how nginx
came to know where to send this request and what happen next all that i need to understand proper depth
working of each and every thing in nginx in detail in simple and easy words and explain me as lay man as
i am beginner and i have very little knowledge about nginx which us very very basic

explain me in real scnerion like i click on google.com then request goes to nginx etc all thise and also answer
'why' on each step and how it came to know ?

so from browser we always get only 2 types of request one with url with / only -> for frontend and other/api/
=> for backend ?

yes i am taking about this for frontend we get request from / and from backend we get request /api/?

like if i don't add api in my backend api's then how browser will know where to send request ?

now request from how it will be look like ?

what if i do like this i set the location in config for like /api/ and when i get the request i will remove the api
then will forward the request to the backend
